

[VERIFIED CREDIT]

SPARK

PAY ONCE. UNLOCK CREDIT.

Pay a deposit on Sepolia. Attestcoin verifies it on-chain. A credit line unlocks on Creditcoin.
No credit check, no paperwork, no bank.

DeFi Track · BUIDL CTC 2026 Fall · Attestcoin Protocol

PROBLEM

Credit needs facts that live on another chain. Today that means trust.

Under-collateralised lending is the growth edge of on-chain credit. Its bottleneck is not capital — it is assessment.

- Assessment today is off-chain: delegates and auditors decide, and enforcement runs through legal process
- When the deciding fact lives on another chain, the options are an **oracle** (a trusted party) or a **bridge** (a repeated point of failure)
- Self-reported history is worthless: a borrower can open and repay their own loan 100 times to manufacture a perfect score

The borrower with a proven position and no way to use it

A DeFi borrower who holds a verifiable position on Ethereum mainnet and needs liquidity on Creditcoin — without selling the position or bridging it.

- Their facts **already exist on-chain**, verifiably. No bureau, no paperwork, no identity attestation
- The alternative today is specific and bad: realise the gain, or accept bridge risk
- Measured, not asserted: **8/8** real wallets rebuilt within 10 bps of the live balance
- **Portable attested standing**: a repaid line becomes proven history that follows the borrower across products and chains — not a score locked inside one app

The unbanked borrower is the destination this reaches. The deposit-free path that gets there is built and covered by 21 tests.

Assessment today is a trusted opinion. It can be a verified fact.

- Private credit is a **\$1.7T** market moving on-chain, and it works today by trusting humans to assess risk off-chain
- Maple and Goldfinch assess through off-chain delegates and auditors, and enforce through legal process
- When the deciding fact lives on another chain the choice is an **oracle** (trust) or a **bridge** (risk). Attestcoin removes the fork by proving the source chain's own record
- Dual proofs verify the payment **and** the current balance — a balance cannot be farmed, self-dealt, or bought
- **Who pays: 10% APR** on drawn credit, accruing on-chain — and no delegate is needed to underwrite the line

SOLUTION

Your on-chain payment history is your credit score

Spark uses the Attestcoin Protocol to prove Sepolia payments on Creditcoin. Verified payment history builds a trustless credit score. No bank forms, no oracle, no paperwork.

- Pay deposit on Sepolia → dual Attestcoin proofs → credit opens on Creditcoin
- On-chain credit score: 650 base + 40 per attested payment (cap 850)
- LTV bonus from payment history (+2.5% at 1+, +5% at 3+ payments)
- No valid proof = no state change. Cryptographic guarantees only.

HOW IT WORKS

Four steps. Fully on-chain.

01

Pay deposit + attest
balance on Sepolia

02

Attestcoin proves both
txs via BlockProver

03

CreditLine opens on
Creditcoin (LTV tier set
by attested balance)

04

Repay on Sepolia →
verify → line closes

Optional: link past Sepolia payments to raise credit score and LTV bonus before opening.

15 Attestcoin surfaces load-bearing, with strict receipt verification

- `openCredit` requires **two** BlockProver proofs: deposit + balance
- Strict receipt log decoding: topic, payer, and **amount** verified from proven data
- One-time `txHash` (replay protected)
- Payer must match `msg.sender`
- **Credit** = **deposit** × **LTV**; attested balance sets the tier (80% / 85% / 90%)
- Payment history adds LTV bonus (+250 / +500 bps)

15 surfaces across 3 attested event kinds: 10 on the critical path, 5 more integrated and tested. Verifier parses receipt RLP from the proven encodedTransaction; a decoded amount that disagrees with the claim reverts. Per Aug 18 AMA: "Transaction fields and their log data are verified and available."

Component	Role
SepoliaPayment	Deposit, repay, balance events
Attestcoin / USC	Cross-chain proof (dual)
CreditLine	Credit + score + history + interest
BlockProver 0x0FD2	On-chain verify

MEASURED, NOT ASSERTED

A position on another chain, rebuilt from proven facts

Credit sizing needs history elsewhere and proof of cover. We rebuilt real Aave V3 positions from mainnet data.

8/8

Real wallets, within
10 bps of live balance

0.51

Largest residual, bps
from rebasing interest

66.8%

Error in event-summing
a position, measured

417

Contract tests
0 failures

- Aave events overstate a real position by **66.8%**: aTokens move without emitting an event
- So the engine reads the **Transfer ledger**, anchored where balance is **provably zero**
- Interest is never invented: positions advance only against an attested state balance
- And it sizes credit: **\$217,276** against \$1,086,382 of proven net worth, at a 20% policy LTV

TRACTION

Five full closed loops on-chain with real USC proofs

5

Full closed loops

Open → Withdraw → Redeem → Repay → Close

10

Attested payments

on-chain credit history

850

Credit score

(max possible)

95%

LTV achieved

(base 90% + 5% history)

All proofs are real Attestcoin USC proofs verified by BlockProver. Three of the five loops were opened, drawn and closed by wallets that are not the founder's: 0x75507D...CAE7, 0x4271A2...ADdb, 0x97a8da...876C. On-chain demo wallet: 0x7A35f63F81357DaDE2cff8f5699b935786Aa9Da2.

Live at spark.sithunyein.com · Contracts verified on Blockscout

Live testnet product, not a slideware demo

- spark.sithunyein.com — live on Creditcoin testnet
- github.com/thesithunyein/spark
- Full flow: pay, prove, borrow, repay, close
- Batch proving: link many payments in one tx
- 417 contract tests, strict RLP amount-binding
- spark.sithunyein.com/onchain — all events, no wallet
- Net-position engine: mainnet history to signed net worth

Contract	Network
SepoliaPayment	Sepolia
AttestcoinPaymentVerifier	Creditcoin testnet
CreditLine + SparkCredit	Creditcoin testnet

Testnet only. Not audited. MIT License.

\$10K to ship credit for the real world

- **Now:** Dual Attestcoin proofs, strict log decoding, credit score and history LTV bonus, live on testnet. 417 tests
- **Built, not deployed:** credit limits sized from a proven position on another chain, not just payment count
- **With \$10K:** Broadcast the position engine, external review of the strict verifier, faster attestation UX
- **CEIP fast-track:** Funded credit book, distribution where borrowers already are, mainnet readiness

Spark turns verified facts into creditworthiness. No bank. No oracle. No delegate. The first borrower is the one with a proven position; the path that reaches everyone else is built, tested, and one deploy away.
