

SPARK

Pay once. Unlock credit.

DeFi credit on Creditcoin. Attestcoin-verified payment history is your credit score.
No bank, no oracle, no paperwork.

DeFi Track · BUIDL CTC 2026 Fall · Attestcoin Protocol

PROBLEM

2.5 billion people can't get credit without paperwork

Most of the world is unbanked. Credit systems require physical documents, bank history, and centralized intermediaries that don't exist for millions of people.

- Cross-chain credit is impossible without a trusted middleman
- Centralized oracles and bridges add single points of failure
- No way to prove payment history across chains trustlessly

SOLUTION

Your on-chain payment history is your credit score

Spark uses the Attestcoin Protocol to prove Sepolia payments on Creditcoin.
Verified payment history builds a trustless credit score. No bank forms, no oracle, no paperwork.

- Pay deposit on Sepolia → dual Attestcoin proofs → credit opens on Creditcoin
- On-chain credit score: 650 base + 40 per attested payment (cap 850)
- LTV bonus from payment history (+2.5% at 1+, +5% at 3+ payments)
- No valid proof = no state change. Cryptographic guarantees only.

HOW IT WORKS

Four steps. Fully on-chain.

01

Pay deposit + attest
balance on Sepolia

02

Attestcoin proves
both txs via
BlockProver

03

CreditLine opens on
Creditcoin (LTV
sized by balance)

04

Repay on Sepolia →
verify → line closes

Optional: link past Sepolia payments to raise credit score and LTV bonus before opening.

ATTESTCOIN PROTOCOL

The deepest Attestcoin integration in this hackathon

- openCredit requires **two** BlockProver proofs: deposit + balance
- Strict receipt log decoding: topic, payer, and **amount** verified from proven data
- One-time txHash (replay protected)
- Payer must match `msg.sender`
- Attested balance sizes LTV (80% / 85% / 90%)
- Payment history adds LTV bonus (+250 / +500 bps)

Component	Role
SepoliaPayment	Deposit, repay, balance events
Attestcoin / USC	Cross-chain proof (dual)
CreditLine	Credit + score + history + interest
BlockProver 0xFD2	On-chain verify

Verifier parses receipt RLP from proven encodedTransaction. Per Aug 18 AMA: "Transaction fields and their log data are verified and available." Amount is cryptographically bound.

TRACTION

Two full closed loops on-chain with real USC proofs

2

Full closed loops

Open → Withdraw → Redeem → Repay → Close

5

Attested payments

on-chain credit history

850

Credit score

(max possible)

95%

LTV achieved

(base 90% + 5% history)

All proofs are real Attestcoin USC proofs verified by BlockProver. On-chain demo wallet: 0x7A35f63F81357DaDE2cff8f5699b935786Aa9Da2.

THE ASK

\$10K to ship credit for the real world

- **Now:** Dual Attestcoin proofs, strict log decoding, credit score, history LTV bonus — live on testnet
- **With \$10K:** Deploy strict verifier to testnet, faster attestation UX (parallel proofs, caching), audit-ready code
- **CEIP fast-track:** Mainnet readiness, lending pool, single-network UX

Spark turns verified payment history into creditworthiness. No bank. No oracle. Just cryptographic proof. This is DeFi credit for the 2.5 billion people the traditional system forgot.
